

A Healthy Workplace for A Healthy Workforce, University of Saskatchewan

This project will conduct an environmental scan of best practices in health promotion in mining and related industries; provide a comparative analysis of key health indicators of the Saskatchewan mining industry including productivity, disability, injury, absenteeism and turnover; and evaluate current nursing practices and other health services in the Saskatchewan mining industry.

The goal is to determine ways to maximize health promotion and worker wellness within a mine site environment as a way to increase productivity by linking healthy workplace environments with healthy employees.
